

Clinical Data Repository

Centralize every member chart in one secure, searchable home

Health plans collect massive volumes of medical records for risk adjustment, quality, audits, and care management. Too often, that documentation ends up siloed across teams and vendors, limiting its value. The result is redundant outreach, provider abrasion, and missed opportunities to maximize value.

The Reveleer Clinical Data Repository centralizes clinical documents in one searchable location, transforming chart retrieval into a durable, enterprise-wide clinical asset. In addition to enterprise chart storage, plans can reuse charts across risk adjustment, quality, audit, and other workflows and make data readily accessible to analytics and data science teams.

The Reveleer Clinical Data Repository helps health plans:

Reduce duplicate chart retrieval and associated vendor and provider costs

Minimize provider abrasion by consolidating requests across teams

Speed audits and submissions with fast, metadata-driven search

Create a durable, reusable asset from every chart

Store and view charts

With the Reveleer Clinical Data Repository, health plan teams can load, update, and deactivate members without tying them to a specific project. They can also store charts from retrieval campaigns, unsolicited submissions, EMRs, and HIEs in one location. Multiple file types can be uploaded, including PDFs, images, and XML.

Intelligent chart intake

Teams can quickly upload charts via bulk UI, SFTP, or API uploading. Additionally, artificial intelligence (AI) supports chart capture to automatically attach files to the correct member while also capturing metadata like provider, group, and date of service.

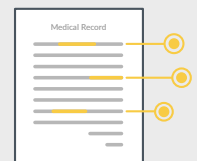

Search and reuse

Within the Clinical Data Repository, teams can search records using member and chart metadata. Then, they can reuse existing charts across risk, quality, audit, and other clinical programs, without duplicating retrieval efforts and causing unnecessary provider abrasion.

Integrations and access

Import and export charts via SFTP and APIs to feed downstream analytics, audits, or internal data warehouses. That way, member data is connected across multiple programs for a centralized, single source of truth.

Security and compliance

Reveleer applies HIPAA and HITRUST-aligned controls across its platform to ensure strong security and compliance. The Clinical Data Repository maintains detailed audit trails for chart access and movement, with role-based permissions to safeguard sensitive information.
